

# BAB 2

## ANAVA 2 JALAN

- Merupakan pengembangan dari ANAVA 1 Jalan
- Jika pada ANAVA 1 jalan → 1 Faktor
- Jika pada ANAVA 2 jalan → 2 Faktor

# Model Linier

$$y_{ij} = \mu + \tau_i + \varepsilon_{ij} \begin{cases} i = 1, \dots, a \\ j = 1, \dots, n \end{cases}$$

Anava 1 jalan

$$y_{ijk} = \mu + \tau_i + \beta_j + \varepsilon_{ijk} \begin{cases} i = 1, 2, \dots, a \\ j = 1, 2, \dots, b \\ k = 1, 2, \dots, n \end{cases}$$

Anava 2 jalan tanpa interaksi

$$y_{ijk} = \mu + \tau_i + \beta_j + (\tau\beta)_{ij} + \varepsilon_{ijk} \begin{cases} i = 1, 2, \dots, a \\ j = 1, 2, \dots, b \\ k = 1, 2, \dots, n \end{cases}$$

Anava 2 jalan dengan interaksi

# Contoh di bidang industri

Seorang eksperimenter ingin mengetahui pengaruh 3 lempeng (A) pada 3 tingkat suhu (B) 15, 70 dan 125 derajat F. 4 baterai dites pada tiap kombinasi antara faktor lempeng dan suhu.

**Table 5-1** Life (in hours) Data for the Battery Design Example

Material Type	Temperature (°F)					
	15		70		125	
1	130	155	34	40	20	70
	74	180	80	75	82	58
2	150	188	136	122	25	70
	159	126	106	115	58	45
3	138	110	174	120	96	104
	168	160	150	139	82	60

Pertanyaan yang muncul adalah :

1. Apakah faktor lempeng berpengaruh terhadap daya hidup baterai ?
2. Apakah faktor suhu berpengaruh terhadap daya hidup baterai?
3. Apakah jenis lempeng material memberikan daya hidup baterai yang seragam tanpa tergantung dari suhu?

**Pertanyaan kedua inilah yang mengindikasikan kita menggunakan rancangan faktorial 2 faktor ( 2 jalan)**

**→ adanya interaksi antara faktor lempeng (A) dengan faktor suhu (B)**

- ▶ Contoh di atas merupakan dari rancangan faktorial (anava 2 jalan).

Jika  $y_{ijk}$  variabel respon saat faktor  $A$  pada tingkat ke  $-i$  ( $i = 1, 2, \dots, a$ ) dan faktor  $B$  pada tingkat ke  $-j$  ( $j = 1, 2, \dots, b$ ) untuk replikasi ke  $-k$  ( $k = 1, 2, \dots, n$ ) maka model linier nya adalah:

$$y_{ijk} = \mu + \tau_i + \beta_j + (\tau\beta)_{ij} + \varepsilon_{ijk} \begin{cases} i = 1, 2, \dots, a \\ j = 1, 2, \dots, b \\ k = 1, 2, \dots, n \end{cases}$$

# Asumsi model Efek Tetap

$$1. \sum_{i=1}^a \tau_i = 0, \sum_{j=1}^b \beta_j = 0, \sum_{i=1}^a (\tau\beta)_{ij} = \sum_{j=1}^b (\tau\beta)_{ij} = 0$$

$$2. \varepsilon_{ijk} \sim NID(0, \sigma^2)$$

---

$$y_{ijk} = \mu + \tau_i + \beta_j + (\tau\beta)_{ij} + \varepsilon_{ijk} \begin{cases} i = 1, 2, \dots, a \\ j = 1, 2, \dots, b \\ k = 1, 2, \dots, n \end{cases}$$

$$y_{ijk} = \mu_{ij} + \varepsilon_{ijk}$$

$$\mu_{ij} = \mu + \tau_i + \beta_j + (\tau\beta)_{ij}$$

$$y_{ijk} = \mu + \tau_i + \beta_j + (\tau\beta)_{ij} + \varepsilon_{ijk}$$

Jika  $\mu_{ij} = \mu + \tau_i + \beta_j + (\tau\beta)_{ij}$

maka  $y_{ijk} = \mu_{ij} + \varepsilon_{ijk}$

Jadi estimasi dari  $y$  adalah

$$\begin{aligned} E[y_{ijk}] &= E[\mu_{ij} + \varepsilon_{ijk}] \\ &= E[\mu_{ij}] + E[\varepsilon_{ijk}] \end{aligned}$$

$$\hat{y}_{ijk} = \hat{\mu}_{ij}$$

# Estimasi dari $\mu_{ij}$

$$E[y_{ij}] = E[\mu_{ij} + \varepsilon_{ij}] = E[\mu_{ij}] = \hat{\mu}_{ij} \Rightarrow \hat{\mu}_{ij} ???$$

$$Q_{ij} = \sum_k^n (y_{ijk} - \mu_{ij})^2$$

$$\frac{dQ_{ij}}{d\mu_{ij}} = 2 \sum_k^n (y_{ijk} - \hat{\mu}_{ij}) \cdot -1 = 0$$

$$\sum_k^n y_{ijk} - \sum_k^n \hat{\mu}_{ij} = 0$$

$$\sum_k^n y_{ijk} = n \hat{\mu}_{ij}$$

$$\frac{\sum_k^n y_{ijk}}{n} = \hat{\mu}_{ij}$$

$$\hat{\mu}_{ij} = \frac{y_{ij\bullet}}{n} = \bar{y}_{ij\bullet}$$

# Step-step uji Anava 2 jalan

## 1. Susun Hipotesis

$$H_{0A} : \tau_1 = \tau_2 = \dots = \tau_a = 0$$

$H_{1A}$  : paling tidak ada satu  $\tau_i \neq 0$

$$H_{0B} : \beta_1 = \beta_2 = \dots = \beta_b = 0$$

$H_{1B}$  : paling tidak ada satu  $\beta_j \neq 0$

$$H_{0AB} : (\tau\beta)_{ij} = 0, \forall ij$$

$H_{1AB}$  : paling tidak ada satu  $(\tau\beta)_{ij} \neq 0$

## 2. Pilih tingkat signifikansi

## 3. Susun Tabel ANAVA 2 Jalan

40 (229)	20	70 (230)	998
75	82	58 (198)	
122 (479)	25	70 (198)	1300
115	58	45 (342)	
120 (583)	96	104 (342)	1501
139	82	60	
1291	770		3799 = $y_{...}$

$$\begin{aligned}
 SS_T &= \sum_{i=1}^a \sum_{j=1}^b \sum_{k=1}^n y_{ijk}^2 - \frac{y_{...}^2}{abn} \\
 &= (130)^2 + (155)^2 + (74)^2 + \dots + (60)^2 - \frac{(3799)^2}{36} = 77,646.97
 \end{aligned}$$

$$\begin{aligned}
 SS_{\text{Material}} &= \frac{1}{bn} \sum_{i=1}^a y_{i..}^2 - \frac{y_{...}^2}{abn} \\
 &= \frac{1}{(3)(4)} [(998)^2 + (1300)^2 + (1501)^2] - \frac{(3799)^2}{36} = 10,683.72
 \end{aligned}$$

$$\begin{aligned}
 SS_{\text{Temperature}} &= \frac{1}{an} \sum_{j=1}^b y_{.j.}^2 - \frac{y_{...}^2}{abn} \\
 &= \frac{1}{(3)(4)} [(1738)^2 + (1291)^2 + (770)^2] - \frac{(3799)^2}{36} = 39,118.72
 \end{aligned}$$

$$\begin{aligned}
 SS_{\text{Interaction}} &= \frac{1}{n} \sum_{i=1}^a \sum_{j=1}^b y_{ij.}^2 - \frac{y_{...}^2}{abn} - SS_{\text{Material}} - SS_{\text{Temperature}} \\
 &= \frac{1}{4} [(539)^2 + (229)^2 + \dots + (342)^2] - \frac{(3799)^2}{36} - 10,683.72 \\
 &\quad - 39,118.72 = 9613.78
 \end{aligned}$$

$$\begin{aligned}
 SS_E &= SS_T - SS_{\text{Material}} - SS_{\text{Temperature}} - SS_{\text{Interaction}} \\
 &= 77,646.97 - 10,683.72 - 39,118.72 - 9613.78 = 18,230.75
 \end{aligned}$$

# Tabel ANAVA

## Analysis of Variance for Battery Life Data

Source of Variation	Sum of Squares	Degrees of Freedom	Mean Square	$F_0$
Material types	10,683.72	2	5,341.86	7.91
Temperature	39,118.72	2	19,559.36	28.97
Interaction	9,613.78	4	2,403.44	3.56
Error	18,230.75	27	675.21	
Total	77,646.97	35		

- Tolak  $H_A$  karena  $F=7.91 > F(0.05,2,27)=3.35$ . Jadi *material types* (jenis lempeng) berpengaruh terhadap daya hidup baterai
- Tolak  $H_B$  karena  $F=28.97 > F(0.05,2,27)=3.35$ . jadi *temperature* (suhu) berpengaruh terhadap daya hidup baterai
- Tolak  $H_{AB}$  karena  $F_{AB}=3.56 > F(0.05,4,27)=2.73$ . Jadi faktor interaksi berpengaruh terhadap daya hidup baterai. D.K.L jenis lempeng material tergantung dari suhu terhadap daya hidup baterai

# Plot Interaksi antara A dan B
