

Manage and Design the Website

Planning

- Identify the **audience**
- State the **goals** of the web site
- Define **interaction** points
- Describe the site both **textually and visually**
- Identify and assess **similar sites**
- Provide a guide for **testing**

Storyboard

- Manage the content and position
- Included color
- Which part is permanent or not

Hi.

I WON'T WAIT LONG.

AT \$55,000, I'M PRICED TO GO.

Personal Site dot-com

[Home](#) [About](#) [Archives](#) [Writing](#) [Speaking](#) [Contact](#)

Li European lingues

Epsum factorial [non deposit quid](#) pro quo hic escorol. Olypian quarrels et gorilla conglomium sic ad nauseum. Souvlaki ignitus carbonundum e pluribus unum. [Defacto](#) lingo est igpay atinlay. Marquee selectus non provisio incongruous feline nolo contendre.

Hello, World!

File and naming

- You need a plan for **putting site** assets in proper place, so you and others who work on the site **can easily find and update the right file at a later date**.
- You need to **name web page files** so they convey **meaningful information to your visitors** as well as you and others who work on the site
 - Have a valid file extension, such as .html, .gif, or .pdf
 - Convey something about the source, contents, or nature of the file
 - Follow a logical and consistent scheme across similar files

- You need to give **meaningful and reliable titles** to your web pages so they are easily distinguished from one another in search results and browser history lists
 - Maintain a consistent format.
 - Use specific language.
 - Make page titles unique.
 - Keep page titles brief.

- You need to follow a dependable pattern for **naming variables in your web site scripts**.
 - Uses unique, concise terms
 - Limits abbreviations
 - Avoids reserved words in its programming language
 - Serves as a form of self-documentation

Layout using Table

- HTML Table and CSS is pretty important to built page layout

The screenshot shows a basic website structure with a header, navigation bar, and two columns of content. The header contains the title "Business Web Site" and a navigation menu with links to Home, Products, Services, About Us, and Contact. Below the header, there are two columns. The left column contains a large gray area with the heading "Epsum factorial non" and some placeholder text. The right column also has a large gray area with the heading "deposit quid pro" and some placeholder text.

This screenshot shows a more complex layout. It features a header with the title "Business Web Site" and a navigation menu. The main content area contains a large gray box with the heading "Epsum factorial non" and placeholder text. To the right of the main content is a sidebar with the heading "deposit quid pro" and placeholder text. Below the main content and sidebar are two smaller sections with headings "sommun paroles" and "consectetuer adipiscing elit.", each with its own set of placeholder text.

This screenshot displays a layout with a header titled "Business Web Site". On the left is a sidebar with the heading "Site Navigation" and links to Home, Products, Services, About Us, and Contact. The main content area contains a section with the heading "Epsum factorial non" and placeholder text. Below it is another section with the heading "deposit quid pro" and placeholder text.

This screenshot shows a layout similar to the previous one. It includes a header, a sidebar with "Site Navigation" and links, and a main content area with sections for "Epsum factorial non" and "deposit quid pro". The content is identical to the layout in the previous screenshot.

- And take a look to any webpage...you will see it how html table and css built the layout
- **The easiest way** and still working
- **Fixed-width layouts use absolute pixel** measurements to determine the width of the page
- **Not fixed width is liquid or expando**, which automatically resizes itself to fit the width of the visitor's browser window

```
<table width="760" border="0" cellpadding="0"
cellspacing="0">
  <tr>
    <td width="760" valign="top">Logo</td>
  </tr>
  <tr>
    <td width="760" valign="top">

<div id="nav" style="position: absolute; width: 200px;">
```

- **Absolute**

Flexible and Fixed Layout

- You need to determine which design format will do the best job of presenting your web site's content for its audience.
 - A **fixed-width** layout that locks page elements in place regardless of the browser window size
 - A **flexible**, or liquid, layout in which content blocks can be resized when the browser window size changes
 - **hybrid layout** that combines both fixed and flexible components

```
#column1 {  
    float: left;  
    width: 150px;  
    margin-left: 5px;  
    background-color: #CCCCCC; }  
  
#column2 {  
    float: left;  
    width: 50%;  
    margin-left: 2%;  
    background-color: #FFFFCC; }
```

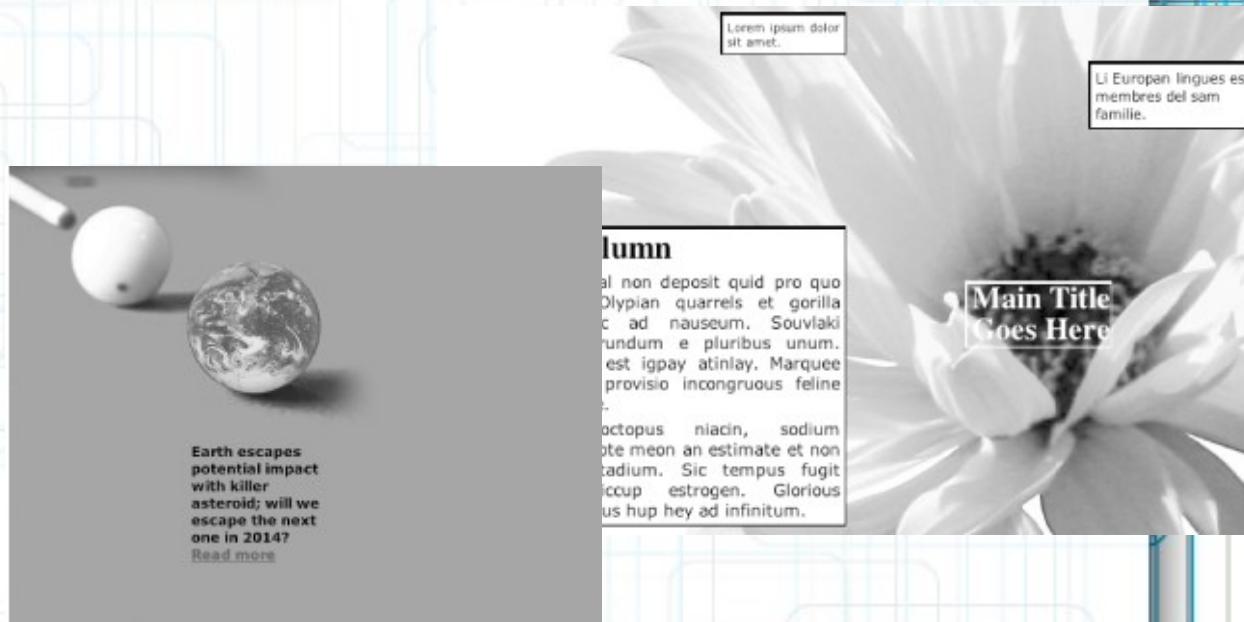

```
<div id="col1">...column 1 content ...</div>  
<div id="col2">...column 2 content ...</div>
```

- You should design your web site only once, not each time you create a new page

Asymmetric Layout

- First, mark up the content with div elements using the id attributes that contain appropriate values representing their placement on the page

```
<div id="header">  
[...]  
</div>  
<div  
id="columnSmall">  
[...]  
</div>  
<div id="columnMain">  
[...]  
</div>  
<div  
id="columnMedium">  
[...]  
</div>
```

- Next, use the position property in each column, setting the value to absolute while setting the placement of the columns with the left and top properties using percentages

```
#header {  
    position: absolute;  
    left: 65%;  
    top: 50%;  
    width: 125px;  
    font-size: small;  
}  
  
#columnSmall {  
    position: absolute;  
    left: 35%;  
    width: 15%;  
    top: 1%;  
    background: #fff;  
    font-size: small;  
}
```

```
#columnMain {  
    position: absolute;  
    left: 5%;  
    width: 45%;  
    top: 40%;  
    background: #fff;  
    text-align: justify;  
    border-width: 0;  
    font-size: large;  
}  
  
#columnMedium {  
    position: absolute;  
    left: 80%;  
    width: 20%;  
    top: 10%;  
    background: #fff;  
}
```

Color Schema

- Sesuaikan dengan tema, brand
- Rencanakan gradasi warna, buat library warna
- Konsisten dengan warna
 - Konsep mixing warna
 - Konsep filosofi warna

Tipografi

- Roman family → klasik, art, keterbacaan kurang bagus
- Serif family → tegas, keterbacaan bagus
- Mixing tipografi

Multimedia Content

- Image, Animation, Video
- Need more space, sometimes problem to be downloaded
- Make sure size is not reason of trouble
- Be aware of copyright.
- Better make by yourself
- Suggestion format: .gif, .png, .mp4, .flv, .swf

- Kuasai at least one editing tool for each media. Ex: Photoshop (raster), corel (vector), audacity (audio), etc...
- Pilih multimedia content sesuai dengan isi webpage/ tema/ tujuan

Adding Images

```
body
{
    background-image: url(/images/backgrounds/penguins.jpg);
    background-position: 0px 0px;
    background-attachment: fixed;
    background-repeat: no-repeat;
    background-color: white;
    margin: 0px;
}
```

- Image also very important
- Define the fix size before upload it (need to prepare the images)

orchid

This beautiful flower is wild and only be found in
Indonesia

Optimizing Images

- You need to minimize the file size of images to be used on your site while retaining as much image quality and color integrity as possible.
- Best format for web (.png,.gif) then .jpg
- Disabling Image Download
 - Disable the right-click (and therefore Save Image) feature
 - Place invisible layers over your images
 - Store images in a protected directory

```
<div id="L2" style="position:absolute; z-index:10">
    
</div>
<div id="L1" style="position:absolute; z-index:5">
    
</div>
```

- Z-index is 3th dimension on webpage.
Higher number will cover the below one

Slicing Images for Layout

- One popular technique for creating Web layouts is slicing
- In slicing, you design the layout as a graphic file
- Use Ur preference tool
 - Design the layout in the graphics editor,
 - Cut the layout into divisions or slices based on the different sections of the page.
 - Export the slices as individual graphics files, you also get an HTML table that reassembles the pieces in a Web browser.

Navigation

- Removing Underlines

```
a:link, a:visited {  
    text-decoration: none;  
}
```

- Add the others

```
a:link, a:visited {  
    text-decoration: none;  
    font-weight: bold;  
    color: #999;  
    background-color: #666;  
}
```

Changing Cursors

- Change the cursor when the mouse pointer rolls over a link

```
a:link, a:visited {  
    cursor: move;  
}
```

- Rollovers

```
a:link {  
    color: #777;  
    text-decoration: none;  
}  
a:visited {  
    color: #333;  
    text-decoration: none;  
}  
a:link:hover, a:visited:hover {  
    color: #777;  
    background-color: #ccc;  
}  
a:link:active, a:visited:active {  
    color: #ccc;  
    background-color: #ccc;  
}
```

```
div.satu:link{  
    background-color: blue;  
    width: 300px;  
    height: 80px;text-decoration: none;  
}
```

```
div.satu:hover{  
    background-color: olive;  
    width: 300px;  
    height: 80px;text-decoration: none;
```

Nongraphical Rollovers

- First, mark up the list of links in an unordered list so that they wrap around a div element with an id attribute

```
<div id="nav">
  <p>Ex of navigation:</p>
  <ul>
    <li><a href="...">Home</a></li>
    <li><a href="...">About</a></li>
    <li><a href="...">Archives</a></li>
    <li><a href="...">Writing</a></li>
    <li><a href="...">Speaking</a></li>
    <li><a href="...">Contact</a></li>
  </ul>
</div>
```

- Next, use the border property on the anchor elements to create the bulk of the design

```

#nav p {
  display: none;
}
#nav {
  font-family: Verdana, Helvetica, Arial, sans-serif;
  font-size: 0.7em;
  font-weight: bold;
  width: 12em;
  border-right: 1px solid #666;
  padding: 0;
  margin-bottom: 1em;
  background-color: #9cc;
  color: #333;
}
#nav ul {
  list-style: none;
  margin: 0;
  padding: 0;
}
#nav ul li {
  margin: 0;
  border-top: 1px solid #003;
}

#nav ul li a {
  display: block;
  padding: 2px 2px 2px 0.5em;
  border-left: 10px solid #369;
  border-right: 1px solid #69c;
  border-bottom: 1px solid #369;
  background-color: #036;
  color: #fff;
  text-decoration: none;
  width: 100%;
}
html>body #nav ul li a {
  width: auto;
}
#nav ul li a:hover {
  border-left: 10px solid #036;
  border-right: 1px solid #69c;
  border-bottom: 1px solid #369;
  background-color: #69f;
  color: #fff;
}

```

Horizontal Menus

- Constructed set of unordered links, as previous slide
- Set the CSS rules for the navigation structure

```
#navsite h5 {  
    display: none;  
}  
  
#navsite ul {  
    padding: 3px 0;  
    margin-left: 0;  
    border-bottom: 1px solid #778;  
    font: bold 12px Verdana, sans-serif;  
}  
  
#navsite ul li {  
    list-style: none;  
    margin: 0;  
    display: inline;  
}  
  
#navsite ul li a {  
    padding: 3px 0.5em;  
    margin-left: 3px;  
    border: 1px solid #778;  
    border-bottom: none;  
    background: #DDE;  
    text-decoration: none;  
}
```

```
#navsite ul li a:link {  
    color: #448;  
}  
  
#navsite ul li a:link {  
    color: #448;  
}  
#navsite ul li a:visited {  
    color: #667;  
}  
#navsite ul li a:hover, #navsite ul li a:visited:hover {  
    color: #000;  
    background: #AAE;  
    border-color: #227;  
}  
#navsite ul li a#current {  
    background: white;  
    border-bottom: 1px solid white;  
}
```
