

PHP

(Intro and Basic)

From several books

Intro

- Its a server side scripting language
- Personal Home Page
- Hypertext Preprocessor
- Make dynamic website, flexible and potent creatures, **more accurately described as applications than a sites** (Larry Ulman)
- More secure

- PHP spt JS, adalah interpreter language-scripting
- PHP lebih prosedural dari JS
- Simple, a lot built in function, famous for a lost web servers
- Good for OO and robust for framework or web services

- Just like the other lang prog, it has those definitions:
 - Variable
 - Data Type
 - Built in function
 - Conditional
 - Loop
 - Operator

- Get, request passes the parameters to the server as a query string. Parameter request dibundelkan pada string URI → bisa di bookmark, semacam download
- Post, request embeds the parameters in HTTP request, not in the URI. Parameter adalah data yg "hidden" di header HTTP Request → tdk bisa di bookmark, probably no backs

- It makes sense to make dynamic website
- PHP and CGI-scripting server can change/manage client view from server
- Jadi server script such PHP lebih banyak kelebihan dr client scripting
- Lebih secure dan some parts dapat menggantikan client scripting

Need to Prepare

- Server side scripting language, ex: PHP, ASP
- Web Server, ex: Apache, IIS, Abyss, Tomcat
- Database Server, ex: MsQL, MySQL, Oracle, for exercise can be used localhost first

Basic

- PHP is an **HTML-embedded** scripting language.
This means that you can intermingle PHP and
HTML code within the same file.
- <?php
.....
?>
- Anything placed within these tags will be
treated by the Web server as PHP
- Put it anywhere

```
<body>
    This is html<br>
    <?php
        print "This is PHP"; // print - built in function in PHP
    ?>
</body>
```

This is html
This is PHP

```
5      <title></title>
6  </head>
7  <body>
8      This is html<br>
9  <?php
10     // put your code here
11     print "This is PHP";
12     print "<br>";
13     print "<font color=red>This is also PHP</font>"; //built in function in PHP
14     ?>
15   </body>
16 </html>
17
```

This is html
This is PHP
This is also PHP

- U can use " " or ' ' for sending data to browser

```
8      THIS IS HTML<!
9
10     <?php
11         // put your code here
12         print "This is PHP";
13         print "<br>";
14         print '<font color=red>This is also PHP</font><br>';
15         echo '<font color=green>This is also PHP</font>';
16         ?>
17     </body>
```

This is html
This is PHP
This is also PHP
This is also PHP

Variable

- **Identifier** (variable's name)—must start with a dollar sign (\$),
- example: **\$input**, **\$a**
- U can assign the value,
- Ex: **\$input = "seven";**, **\$a=7;**
- **"="** be called **assignment operator**

Data Type

- PHP has eight data types.
 - scalartypes—**Boolean** (TRUE or FALSE), **integer**, **floating point** (decimals), and **strings** (characters)
 - two nonscalar (multivalued)—**arrays** and **objects**;
 - plus **resources** (which you'll see when interacting with databases) and **NULL** (which is a special type that has no value).

Tips

- Step awal, sama spt JS, love dan buat anda familiar dgn PHP built in function
- PHP has a lot built in function → Authentication, Audio, Image, SE, Date/Time, Calender, Database, Crypto, Compression, etc
- Make sure always get involved to **<http://php.net> and the other tutorial, forum, PHP School, etc**
- IDE, make easier to learn the function

- Mulai dari built in function yang akan sering digunakan:
 - String, termasuk reguler expression
 - Math, termasuk pengolah number
 - Date/ Time, Array, File termasuk direktory, Mail, Security termasuk crypto, database termasuk MySQL

String

- \$one ="satu"; \$two ="dua"; \$three="tiga";
- Concatenation is like addition for strings,
concatenation operator (.)

- Then u can use,

- ```
$one="satu";$two="dua";$three="tiga";
echo $one.$two.$three;
echo $one." ".$two." ".$three;
```

satu  
dua  
tiga

satu

```
echo "$one
";
```

- Built in String function → a lot, explore it by Urself

- ```
echo strtoupper($one)."  
$one2="SaTu JuGa";  
echo strtolower($one2)."  
?>  
  
echo strtoupper($one)."  
echo strtolower($one2)."  
$one2="satu juga";  
echo ucfirst($one2)."  
echo ucwords($one2)."  
?>
```

SATU
satu juga

SATU

Satu juga
Satu Juga

addcslashes — Quote string with slashes in a C style
 addslashes — Quote string with slashes
 bin2hex — Convert binary data into hexadecimal representation
 chop — Alias of rtrim
 chr — Return a specific character
 chunk_split — Split a string into smaller chunks
 convert_cyr_string — Convert from one Cyrillic character set to another
 convert_uudecode — Decode a uuencoded string
 convert_uuencode — Uuencode a string
 count_chars — Return information about characters used in a string

crc32 — Calculates the crc32 polynomial of a string

crypt — One-way string encryption (hashing)

echo — Output one or more strings

explode — Split a string by string

fprintf — Write a formatted string to a stream

get_html_translation_table — Returns the translation table used by htmlspecialchars and htmlentities

hebrev — Convert logical Hebrew text to visual text

hebrevc — Convert logical Hebrew text to visual text with newline conversion

html_entity_decode — Convert all HTML entities to their applicable characters

htmlentities — Convert all applicable characters to HTML entities

`htmlspecialchars_decode` — Convert special HTML entities back to characters

`htmlspecialchars` — Convert special characters to HTML entities

`implode` — Join array elements with a string

`join` — Alias of `implode`

`lcfirst` — Make a string's first character lowercase

`levenshtein` — Calculate Levenshtein distance between two strings

`localeconv` — Get numeric formatting information

`ltrim` — Strip whitespace (or other characters) from the beginning of a string

`md5_file` — Calculates the md5 hash of a given file

`md5` — Calculate the md5 hash of a string

- etc

Date/ Time

```
<style>
    .col1{
        color: blue;
    }
    .col2{
        color:red;
    }
</style>
</head>
<body>
    <script type="text/javascript">
todaynow = new Date(); //get day and time
document.write("<p> <font class='col1'>" + todaynow + "</font></p>");
</script>
<?php

date_default_timezone_set('Asia/Indonesia');
echo "<p class='col2'>".date('l JS \of F Y h:i:s A');echo "</p><br>";
?>
```

2     echo "accepted<br>";
3 }
4 else{
5     echo "rejected<br>";
6 }
```

rejected
accepted

- ## Switch

The switch conditional compares the value of \$variable to the different cases. When it finds a match, the following code is executed, up until the break. If no match is found, the default is executed, assuming it exists (it's optional)

```
switch ($variable) {  
    case 'value1':  
        // Do this.  
        break;  
    case 'value2':  
        // Do this instead.  
        break;  
    default:  
        // Do this then.  
        break;  
}
```

```
$i=date(N);
switch ($i){
    case 1:
        echo "OMG...look its already Monday, move!!!<br>";
        break;
    case 2:
        echo "Hmm...Tuesday morning, Web Programming time,
              no worries its the easiest course i have<br>";
}

```

Hmm...Tuesday morning, Web Programming time, no worries its the easiest course i have

Loop

- for, while, foreach

```
while (condition)
{
// ....
}
```

As long as the condition part of the loop is true, the loop will be executed.

```
for (initial; condition;closing) {
// .....
}
```

Upon first executing the loop, the initial expression is run. Then the condition is checked and, if true, the contents of the loop are executed. After execution, the closing expression is run and the condition is checked again.

```
53
54     $j=0;
55     while ($j<=7){
56         for ($k=0;$k<=$j ;$k++){
57             echo "*";
58         }
59         echo "<br>";
60         $j++;
61     }
62
63
64     $j=0;
65     while ($j<=7){
66         for ($k=0;$k<=$j ;$k++){
67             if (($k%2)==0){
68                 echo "<font color=red>*</font>";
69             }elseif((($k%2)==1){
70                 echo "<font color=green>*</font>";
71             }
72         }
73         echo "<br>";
74         $j++;
75     }
```

Working with Form

- Form is very important in dynamic page and perhaps the most important one
- U have already learned in HTML section, havent U? Mean already understood, not yet? U still have a time

- Lets break this simple example

```
1 |   <body>
2 |     <form name="ex1" method="post" action="index3.php">
3 |
4 |   </form>
```

tag action dictates to
which page the form data will be sent

The method attribute of a form dictates
how the data is sent to the handling page

- The **get method** sends the submitted data to the receiving page as a series of name-value pairs appended to the URL.
- The benefit of using the get method is that the resulting page can be bookmarked in the user's Web browser (since it's a URL).
- For that matter, you can also click Back in your Web browser to return to a get page, or reload it without problems

- Sends the submitted data to the receiving page as a series of name-value pairs appended to the URL
ex: `http://example.com/?name=uns`
- But there is a **limit in how much data** can be transmitted via get, and this method is **less secure** (since the data is visible) and can be entered via URL
- Generally, get is used **for requesting information**, like a particular record from a database or the results of a search (searches almost always use get)

- The post method is used when an action is required,
- as when a database record will be updated or an email should be sent.
- More secure, not embed value in URL

```
<body>
  <form name="ex1" method="post" action="index3.php">
    <h4>Ok buddy, gimme a brief about U</h4>
    Name : <input name="Uname" type="text" size="15" maxlength="100"><br>
    Gender : <input type="radio" name="Ugender" value="female">Female <input type="radio" name="Ugender" value="male">Male
    Email : <input name="Uemail" type="text" size="30" maxlength="500"><br>
    Mobilephone : <input name="Umphone" type="text" size="15" maxlength="15"><br>
    A brief of U, dont be shy write here :<br>
    <textarea name="UU" rows="5" cols="50"></textarea><br>
    <input type="submit" name="Usub" value="Send"> <input type="reset" name="Ures" value="clear">
  </form>
</body>
```

Ok buddy, gimme a brief about U

Name :

Gender : Female Male

Email :

Mobilephone :

A brief of U, dont be shy write here :

- Let php handle it
- Whatever the user types into those elements will be accessible via a PHP variable named `$_REQUEST['...']`
- Yes, case sensitive, below not same
- `$_REQUEST['Uname']`,
`$_REQUEST['UName']`,
`$_REQUEST['uname']`

```
<?php
    // remove uneeded chars

    $name=strip_tags($_REQUEST['Uname']);
    $gender=$_REQUEST['Ugender'];
    $email=strip_tags($_REQUEST['Uemail']);
    $mphone=strip_tags($_REQUEST['Umphone']);
    $u=strip_tags($_REQUEST['UU']);
    echo "Thanks buddy, Ur name ";
    echo ucwords($name)."<br>";
    if (strlen($name)>=40){
        echo "ow MG, U have such a long name buddy ";
    }
    echo "and U are an happy ".$gender.", i hope<br>";
    echo "we can contact U, email ".$email." <br>";
    if (preg_match('^\@\?.\^', $email)){
        echo "see what just U got in ".$email." <br>";
    }else{
        echo "but is this true email, buddy? please check it again<br>";
    }
    echo "or mobilephone ".$mphone;
    if (preg_match('/[0..9]/', $mphone)){
        echo " so dont angry if we will bother U<br>";
    }
    else{
        echo " but, is this true number, check it again";
    }

?>
```

Ok buddy, gimme a brief about U

Name : <h1>Yuni</h1>

Gender : Female Male

Email : yu@yu

Mobilephone : 09878765

A brief of U, dont be shy write here :

Oke

Thanks buddy, Ur name Yuni
and U are an happy female ,i hope
we can contact U, email yu@yu
but is this true email, buddy? please check it again
or mobilephone 09878765 so dont angry if we will bother U

Name : <h1>Yuni</h1>

Gender : Female Male

Email : yu@yu.yu

Mobilephone : 877h87787887

A brief of U, dont be shy write here :

<h1>0ke 0ke oye yes</h1>

Send

clear

Thanks buddy, Ur name Yuni
and U are an happy female ,i hope
we can contact U, email yu@yu.yu
see what just U got in yu@yu.yu
or mobilephone 877h87787887 but, is this true number, check it again

Character Classes

CLASS	SHORTCUT	MEANING
[0-9]	\d	Any digit
[\f\r\t\n\v]	\s	Any white space
[A-Za-z0-9_]	\w	Any word character
[^0-9]	\D	Not a digit
[^\f\r\t\n\v]	\S	Not white space
[^A-Za-z0-9_]	\W	Not a word character

Meta-Characters

CHARACTER	MEANING
\	Escape character
